Office Hours (Room 5C.30)
Mon 15:15 – 16:00
Tue 14:15 – 15:00

Readings:

- Gruber, J. (2005). Public finance and public policy. Macmillan.
- Varian, H. R. (2014). Intermediate Microeconomics: A Modern Approach: Ninth International Student Edition. WW Norton & Company.

The Coase theorem

- Subject to income effects, the allocation of resources will be independent of the assignment of property rights when costless trades are possible.
- (The Coase Theorem) In a competitive economy with complete information and zero transaction costs, the allocation of resources will be efficient and invariant with respect to legal rules of entitlement.
- In other words..
- If there is a good institution for trade and low transaction costs, bargaining will lead to Pareto efficient outcome regardless of the initial allocation of property.

What happens in the market assuming that a person can only eat 1 cheesecake?

- who is going to be a seller and who is going to be a buyer?
- how many trades would you expect to happen?
- what would be the market clearing (median) price?

Expected number of trades: 3

Expected clearing (median) price: 6.5

How can we test the theoretical prediction?

- Smith, Vernon L. “An Experimental Study of Competitive Market Behavior.” *Journal of Political Economy*, 70.2 (1962): 111-137.
- Laboratory environment
- Each participant either assigned a role of a buyer or seller
- Induced value – each buyer privately assigned max. willingness to pay (WTP), each seller privately assigned min. willingness to accept (WTA)
- Note: each participants only knows his private information, has no other information (about WTPs/WTAs of others, number of traders etc.)

TABLE 1

Test	Trading Period	Predicted Exchange Quantity (x_0)	Actual Exchange Quantity (x)	Predicted Exchange Price (P_0)	Average Actual Exchange Price (\bar{P})	Coefficient of Convergence [$a = (100 \sigma_0) / (P_0)$]	No. of Sub-marginal Buyers Who Could Make Contracts	No. of Sub-marginal Buyers Who Made Contracts	No. of Sub-marginal Sellers Who Could Make Contracts	No. of Sub-marginal Sellers Who Made Contracts
1.....	1	6	5	2.00	1.80	11.8	5	0	5	0
	2	6	5	2.00	1.86	8.1	5	0	5	0
	3	6	5	2.00	2.02	5.2	5	0	5	0
	4	6	7	2.00	2.03	5.5	5	1	5	1

TEST 3

CHART 5

TEST 5A AND TEST 5B

And how about you?

I am happy to buy a cake for 7 EUR.
I am happy to sell a cake for 7 EUR.

WTP vs. WTA

- The standard assumptions of economic theory imply that differences between an individual's maximum willingness to pay (WTP) for a good and minimum compensation demanded for the same entitlement (willingness to accept [WTA]) should be negligible
- The assumption that entitlements do not affect value contrasts sharply with empirical observations of significantly higher selling than buying prices.
- Kahneman, D., Knetsch, J. L., & Thaler, R. H. (1990). Experimental tests of the endowment effect and the Coase theorem. *Journal of political Economy*, 98(6), 1325-1348.

The endowment effect

- Thaler (1980) labeled the increased value of a good to an individual when the good becomes part of the individual's endowment the "endowment effect." This effect is a manifestation of "loss aversion".
- If a good is evaluated as a loss when it is given up and as a gain when it is acquired, loss aversion will, on average, induce a higher dollar value for owners than for potential buyers, reducing the set of mutually acceptable trades.
- Kahneman, D., Knetsch, J. L., & Thaler, R. H. (1990). Experimental tests of the endowment effect and the Coase theorem. *Journal of political Economy*, 98(6), 1325-1348.

TABLE 2
RESULTS OF EXPERIMENT 1
INDUCED-VALUE MARKETS

Trial	Actual Trades	Expected Trades	Price	Expected Price
1	12	11	3.75	3.75
2	11	11	4.75	4.75
3	10	11	4.25	4.25

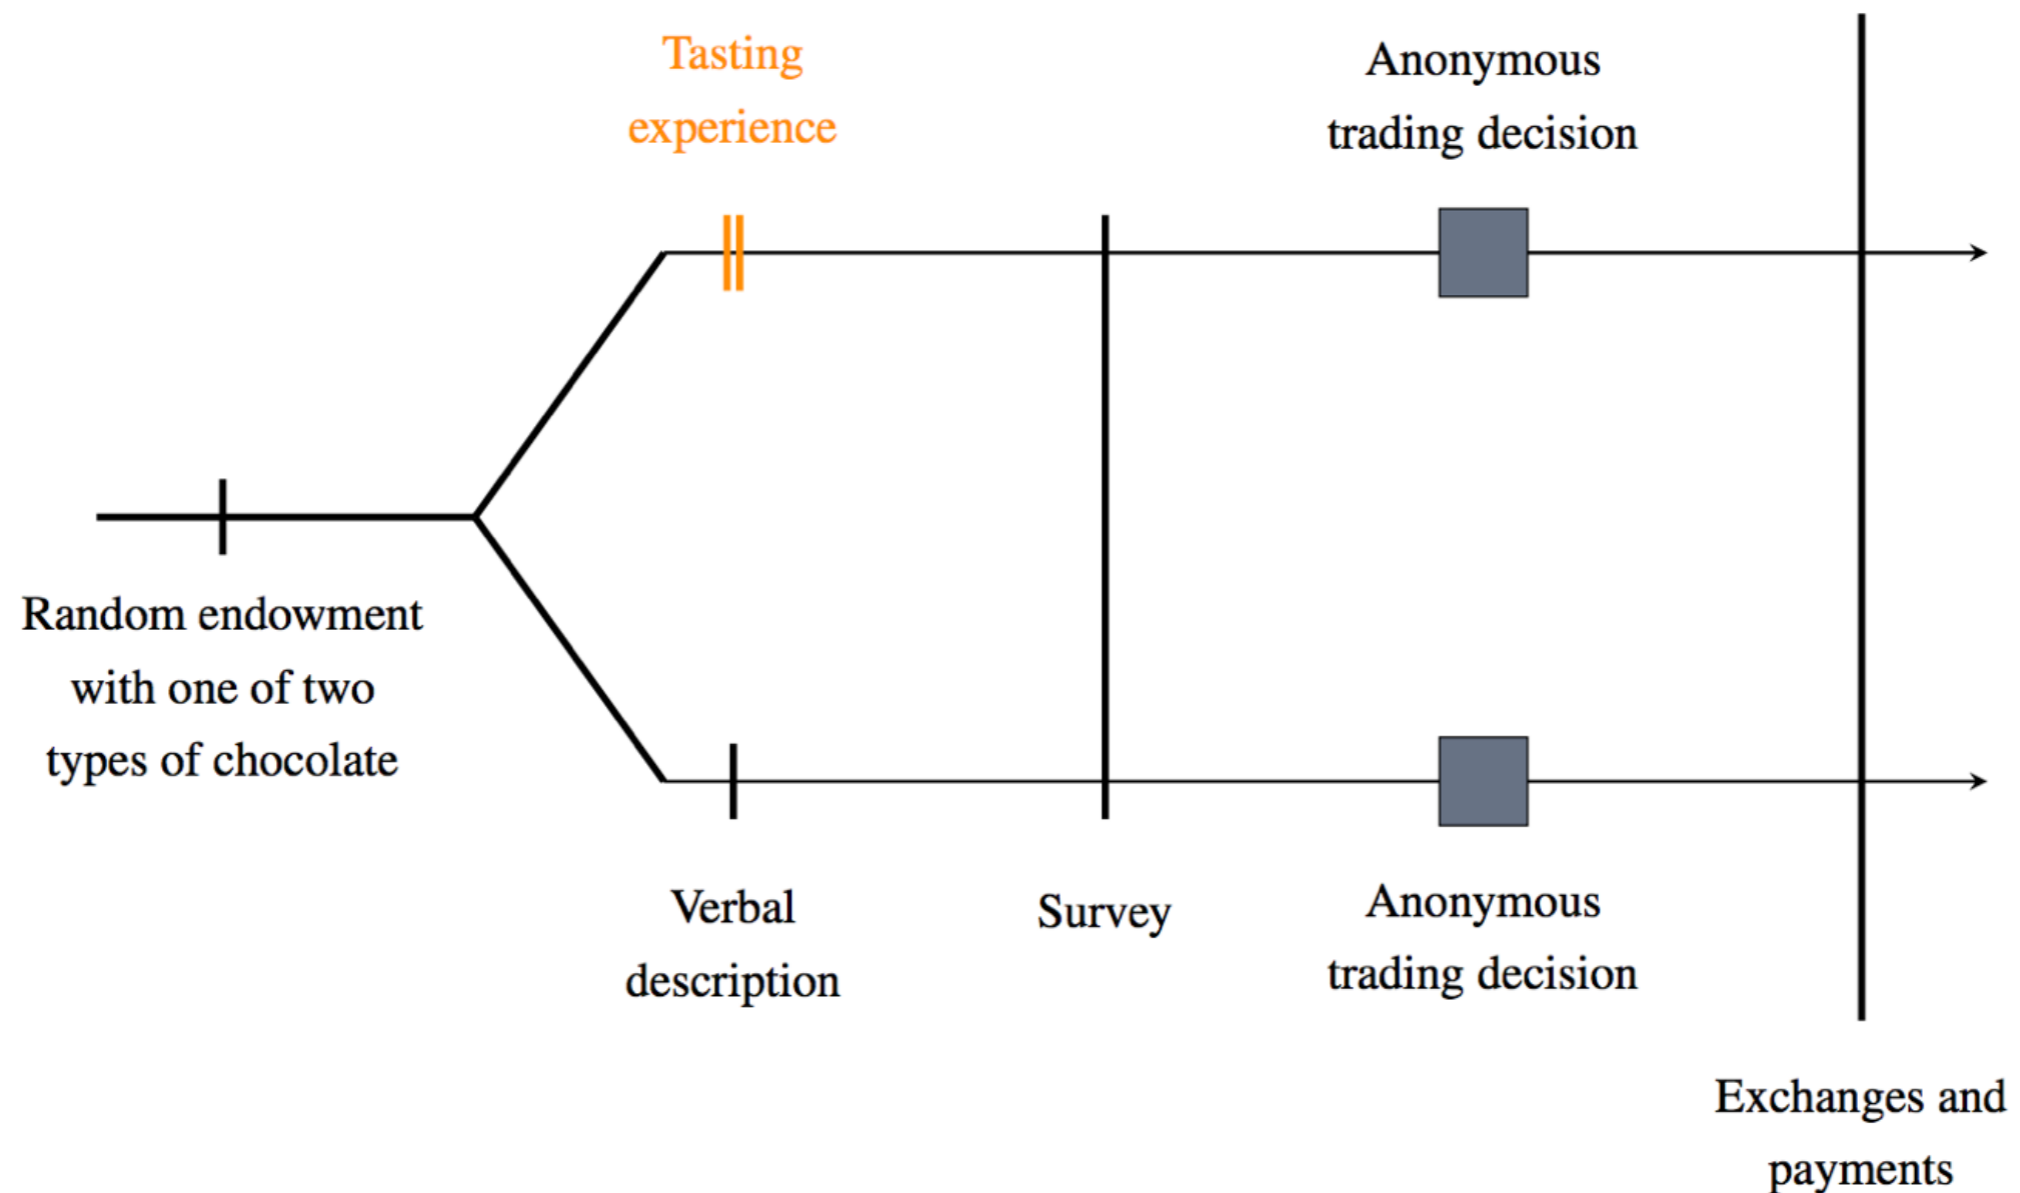

CONSUMPTION GOODS MARKETS

Trial	Trades	Price	Median Buyer Reservation Price	Median Seller Reservation Price
Mugs (Expected Trades = 11)				
4	4	4.25	2.75	5.25
5	1	4.75	2.25	5.25
6	2	4.50	2.25	5.25
7	2	4.25	2.25	5.25
Pens (Expected Trades = 11)				
8	4	1.25	.75	2.50
9	5	1.25	.75	1.75
10	4	1.25	.75	2.25
11	5	1.25	.75	1.75

The Endowment Effect in Choices between Goods

- Undertrading happens not only in exchanges of money and consumption goods, but also in the exchange between two goods.
- Participants were either offered of a choice between chocolate and a mug, or were given a mug, or were given a chocolate. All of them had an opportunity to change their endowment at the end of the class
- For most participants a mug was more valuable than the chocolate when the mug had to be given up but less valuable when the chocolate had to be given up.
- Knetsch, Jack L. "The Endowment Effect and Evidence of Nonreversible Indifference Curves." A.E.R. 79 (December 1989): 1277-84.

Choice Uncertainty and the Endowment Effect

Choice Uncertainty and the Endowment Effect

Table 3 Summary statistics (Experiment 1)

Treatment	Endowment	N	Mean (Standard Error)
Control	Endowed (WTA)	29	3.26 (0.490)
	Not endowed (WTP)	30	0.94 (0.241)
	Avg. WTA/Avg. WTP		3.47
Taste treatment	Endowed (WTA)	25	2.25 (0.275)
	Not endowed (WTP)	28	1.30 (0.266)
	Avg. WTA/Avg. WTP		1.73

Implications of the endowment effect on individual choice

- Suppose that
 - good Y = extra income
 - good X = extra vacation days
- You are at point A and are offered either higher income or more vacation. You are indifferent between the 2 new states (B and C).

Endowment effect in the wild

- People demand more to give up entitlements such as time, intellectual property, public land, and environmental, health, and safety regulations than they are willing to pay to acquire them.
- People who inherit shares of stock from deceased relatives are refusing to divest those shares, even if they do not fit with that individual's risk tolerance or investment goals.
- Hypothetical selling price for NCAA final four tournament tickets were 14 times higher than their hypothetical buying price.
- The endowment effect has also been raised as a possible explanation for the lack of demand for reverse mortgage opportunities.

Evolutionary perspective

Figure 1. A photograph depicting the token exchange method in capuchins. Here, one capuchin subject, Auric, trades a token for a food reward.

- biased preferences rely on cognitive systems that are more evolutionarily ancient than previously thought
- human economic biases such as loss aversion and reference dependence are shared with an ancestrally related New World primate, the capuchin monkey
- Lakshminaryanan, Venkat, M. Keith Chen, and Laurie R. Santos. "Endowment effect in capuchin monkeys." *Philosophical Transactions of the Royal Society B: Biological Sciences* 363.1511 (2008): 3837-3844.
